

AccuPort 432[®] Update

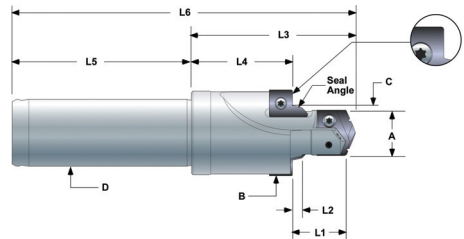

Introducing ISO 6149 Metric Inserts without ID Ridge

AMEC has extended the versatility of the unique AccuPort 432[®] single pass hydraulic port contour cutter with the launch of the new ISO 6149 Metric Port Contour inserts without the identification ridge as a standard stocked item.

The new inserts form part of AMEC's extensive AccuPort range of holders and inserts and are manufactured from C5 Carbide with a TiAlN coating. They are also fully interchangeable and compatible with existing AccuPort holders, designed to produce ridged ports, giving users increased production versatility while maintaining high productivity.

As with all AccuPort 432[®] cutters and inserts, the new range enables hydraulic ports to be produced in a single step, ready for threading, rather than multiple machining operations.
